#### **DETAILED ACTION**

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

1. Claims 1,3, 5, 7-10, 12,13,15, 18-21, 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim (US Pub No. 2002/0106891).

As to claim 1, Kim discloses a method of fabricating a semiconductor device having a low dielectric layer (paragraph 0002) consisting of:

(a) substrate (100) (Fig.2) (paragraph 0035);

(b) Forming a low k dielectric layer consisting of an silicon oxycarbide layer (110) (organo-silicon material) on said substrate (paragraph 0035);

- (c) Performing a treatment of He plasma on said low k dielectric layer in a process chamber to form a transformed low k dielectric layer (paragraph 0036); and
- (d) Performing treatment with H<sub>2</sub> plasma on the transformed low k dielectric layer in a process chamber (paragraph 0048)(Table 1).

Although the reference of Kim discloses that hydrogen and helium are suitable plasmas for forming a layer of an organic polymer group over the regenerated surface of silicon oxycarbide, the reference fails to disclose a specific example wherein a first plasma treatment is conducted using helium plasma gas followed by a second treatment using hydrogen gas.

Kim suggests the use of He, O<sub>2</sub> and H<sub>2</sub> plasma treatment to modify the physical properties of layers (paragraph 0058). Kim, is however silent about the order of the plasma treatment. It is noted that Kim fails to disclose applicant's specific sequence of (a) a first treatment of He plasma and (b) second treatment of H<sub>2</sub> plasma. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the sequence of steps in Kim to include any order of step (a) and (b) because the final product of Kim appears to be similar to the product produced by applicant's claimed sequence of processing steps. Since each step imparts separate and distinct properties to the

Art Unit: 1765

dielectric material, it appears that a similar product would be produced regardless of the sequence of steps. Ex parte Rubin, 128 USPQ 440 (Bd. App. 1959).

As to claim 3, Kim discloses low k dielectric layer consisting of doped silicon oxide (paragraph 0058), hydrogen silsequioxane (HSQ), or methysilsequioxane (MSQ) (paragraph 0005).

As to claim 5, Kim discloses the use of plasma enhanced CVD (PECVD) for plasma treatment (paragraph 0062).

As to claim 7, Kim discloses the plasma treatment during a period of about 10-200 seconds (paragraph 0048) that overlap the values disclosed by the applicant.

As to claim 8, 18 and 30 Kim discloses the process chamber pressure in the range of about 1 to 10 Torr (paragraph 0048) that overlap the range disclosed by the applicant.

As to claim 9 and 19, Kim discloses the plasma treatment with RF power of about 200 Watts that is close to the value disclosed by the applicant. Therefore, it would be obvious to one of ordinary skill in the art at the time of invention to select the RF power suggested by the applicant because Kim

suggest that the process parameters can be changed according to the treatment conditions of subsequent process of a semiconductor device (paragraph 0048).

As to claim 10 and 20, Kim discloses that the substrate is heated between 250 to 400°C that overlaps the range suggested by the applicant.

As to claim 12, Kim discloses wherein the transformed low k dielectric layer (silicon oxycarbide layer) is enriched with Si-H bonds during the  $H_2$  treatment (paragraph 0048).

As to claim 13, Kim discloses a method of lowering the dielectric constant and increasing the thermal and mechanical stability of a low k dielectric layer in a damascene process (paragraph 0051), consisting of:

- (a) Providing a substrate having an etch stop layer (131)(Fig.7 and 8) (paragraph 0052);
- (b) Depositing a low dielectric layer consisting of an organosilicon compound (111)(Fig. 7 and 8) (paragraph 0051)
- (c) Performing a first treatment consisting of He plasma on said low k dielectric layer in a process chamber to form a transformed low dielectric layer (paragraph 0062).
- (d) Performing a plasma treatment with H2 plasma on transformed low k dielectric layer for form a composite low k dielectric layer consisting of a

Art Unit: 1765

transformed low k dielectric layer that is enriched in Si-H bonds (paragraph 0048) on a transformed low k dielectric layer that has a mechanically stabilized network of Si-O bonds (paragraph 0049).

- (e) Forming an opening/hole in the composite low dielectric layer that extends through said etch stop layer (paragraph 0051); and
- (f) Depositing a diffusion barrier layer on the sidewalls of said opening/hole, depositing a metal layer on said barrier that fills said opening/hole, and planarizing said metal layer and said diffusion barrier layer to a level that is coplanar with the composite low k dielectric layer (paragraph 0052).

Although Kim suggest the use of He plasma treatment in the formation of low k dielectric material, does not expressly disclose its use in the damascene process as claimed by the applicant.

Kim suggests the use of He, O<sub>2</sub> and H<sub>2</sub> plasma treatment to modify the physical properties of layers (paragraph 0058). Kim, is however silent about the order of the plasma treatment. It is noted that Kim fails to disclose applicant's specific sequence of (a) a first treatment of He plasma and (b) second treatment of H<sub>2</sub> plasma. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the sequence of steps in Kim to include any order of step (a) and (b) because the final product of Kim appears to be similar to the product produced by applicant's claimed sequence of processing steps. Since each step imparts separate and distinct properties to the

Art Unit: 1765

dielectric material, it appears that a similar product would be produced regardless of the sequence of steps. Ex parte Rubin, 128 USPQ 440 (Bd. App. 1959).

As to claim 15, Kim discloses that the thickness of low k dielectric layer is consisting of carbon doped silicon oxide layer is about 5000 Å (paragraph 0059).

As to claim 21, Kim discloses that low k dielectric layer enriched in Si-H bond has a thickness from about 5000 Å (0059).

As to claim 23, Kim discloses the use of Ti/TiN as the barrier metal layer and copper metal layer (paragraph 0057).

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 2, 4, 6 11, 14, 16, 17, 22, 28 and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim (US Pub No. 2002/0106891)(see teachings of Kim above) in view of Grill (US Patent No. 6,147,009).

Art Unit: 1765

As to claim 2 and 14, Kim does not specifically disclose the process of curing the low k dielectric layer before performing the He plasma treatment. However, Grill discloses the heat treatment (curing) of film at a temperature not less than 300°C (col. 3, lines 1-2). Therefore, it would be obvious to one of ordinary skill in the art at the time of invention to select curing of dielectric layer because Grill reveals that curing process improves the stabilization of low-k film (col.7, lines 9-13). The selection of any order of curing is prima facie obvious. Ex parte Rubin, 128 USPQ 440 (Bd. App. 1959).

As to claim 4 and 16, Kim is silent about the atomic percentage ratios in the composition of SiCOH. However, Grill discloses the composition of SiCOH: about 5-40 atomic % of Si; about 5-45 atomic percent of C; about 0-50 atomic percent of O; about 10-55 atomic percent of H that overlap the atomic percent of compositions selected by the applicant (col.6, lines 25-33). Therefore, it would be obvious to one of ordinary skill in the art at the time of invention to modify the atomic percent of components because Grill illustrates that the atomic percent of compositions would determine thermal stability of low dielectric constant materials suitable for integration in a BEOL wiring structure (col.5, lines 12-17).

As to claim 6 and 17, Kim does not expressly disclose the gas flow rate. However, Grill discloses the precursor flow rate at between 5-200 sccm (col.3, lines 35-36). According to Grill, the films can be prepared by choosing a suitable

Art Unit: 1765

precursor and a specific combination of processing parameters such as flow rate, pressure in reactor and substrate temperature (col.5, lines 38-42) that can be optimized to obtain low-k films. See MPEP § 2144.05 II. It would have been obvious to one of ordinary skill in the art to select any flow rate in the process of Kim, including applicant's flow rate in calim 6, because reference of Grill illustrates that flow rate is a parameter which can be optimized to obtain a low k film.

As to claim 11, Kim discloses the one or more gases selected from the group of He, H<sub>2</sub>, O<sub>2</sub> and Ar in a substrate-loaded processing chamber (paragraph 0022). Kim does not expressly disclose whether the plasma treatment of different gases is done without breaking chamber vacuum. Grill discloses the use of insitu process for annealing and depositing of low k dielectric material to enhance the thermal stability of films (col.7, lines 1-13). Therefore, it would be obvious to one of ordinary skill in the art at the time of invention to perform first and second treatment in the same chamber without breaking chamber vacuum in the process of Kim because Grill suggests that in-situ process can enhance thermal stability of the low k dielectric films (col.7, lines 15-18).

As to claim 17, Kim discloses the duration of plasma treatment from about 30-50 second (paragraph 0048) that overlap the range cited by the applicant.

Art Unit: 1765

As to claim 22, Kim does no expressly reveal the plasma treatment of first and second type in the same process chamber. Grill discloses the use of in-situ process for annealing and depositing of low k dielectric material to enhance the thermal stability of films (col.7, lines 1-13). Therefore, it would be obvious to one of ordinary skill in the art at the time of invention to perform first and second treatment in the same chamber because Kim suggests that in-situ process can enhance thermal stability of the low k dielectric films (col.7, lines 15-18).

### Response to Arguments

3. Applicant's arguments filed on 10/25/2006 have been fully considered but they are not persuasive.

With reference to claims 1 and 13, Kim discloses the plasma treatment by H<sub>2</sub> plasma and He plasma treatments (see Table I on page 3). Kim discloses the relative dielectric constant resulting from performing the plasma treatment of several types under the same conditions with the preferred embodiment after forming the silicon oxycarbide layer. Kim concludes that the plasma treatment does not have significant influence on the relative dielectric constant of the silicon oxycarbide layer (paragraph 0044).

However, in embodiment 2, Kim has demonstrated that when the  $H_2$ plasma is applied to silicon oxycarbide layer, the mechanical strength of the
silicon carbide layer and the adhesive force with other layers are increased
(paragraph 0049). In embodiment 3, Kim has demonstrated that using  $H_2$  plasma

Art Unit: 1765

treatment one can reduce the increase in the dielectric constant of silicon oxycarbide layer and mechanical damage (paragraph 0055). Kim further discloses the process of decreasing the parasitic capacitance by 15-30% in comparison with the conventional silicon oxycarbide that is not treated with H<sub>2</sub> plasma (paragraph 0059). Although there is no significant difference in terms of the dielectric constant of the silicon oxycarbide layer with H<sub>2</sub> or He plasma treatment, Kim demonstrates difference in other properties such as mechanical strength and parasitic capacitance of SiOC layer. As a result, any combination of plasma treatments with the disclosed known plasma would produce results that give rise to different physical properties of SiOC layer depending on the process parameters. Since both hydrogen and helium are suitable, a process involving both plasmas would not distinguish a process using single plasma.

### Allowable Subject Matter

Claims 24-34 are allowable.

4. The following is a statement of reasons for the indication of allowable subject matter: The closest prior art of Kim (US Pub.No. 2002/0106891) does not teach or suggest applicants' step of "providing a substrate with a metal layer comprised of metal lines having a top surface and sidewalls formed thereon and an anti-reflective coating (ARC) formed on the top surface of said metal lines" as defined in claim 24.

Art Unit: 1765

#### Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Chen (US Patent No. 5,858,869) discloses a method for fabricating inter-metal dielectric insulation using anisotropic plasma oxides and low dielectric constant polymers.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Maki A. Angadi whose telephone number is 571-272-8213. The examiner can normally be reached on 8 AM to 4.30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nadine G. Norton can be reached on 571-272-1465. The fax phone number for the organization where this application or proceeding is
